Agentic AI

Research Workflow Agents

- **Literature & evidence synthesis:** Elicit (extracts data and screens papers for systematic reviews), Consensus (gives evidence-weighted answers via a "Consensus Meter"), Scite (analyzes how a paper has been cited — supporting vs. contradicting)
- **NotebookLM:** lets you load a pile of PDFs/notes and chat across them — good for synthesizing your own paper collection or project notes

Desktop & Productivity Agents

- **Cowork (Anthropic):** desktop agent for non-coders — give it a goal and it reorganizes files, drafts reports from notes, builds spreadsheets; pairs with Claude in Chrome for browser tasks; still in research preview with some rough edges
- **Microsoft 365 Copilot:** built into Outlook/Word/Excel for drafting, summarizing, and analysis; newer "Think Deeper" mode enables more autonomous multi-step document edits
- **Google Workspace Gemini:** integrated across Gmail, Calendar, Drive, Docs, Sheets, and Slides

Task & Project Planning

- Notion AI / Asana AI add agentic planning (scheduling, prioritization, status tracking) on top of project-management tools labs may already use for experiments and grant timelines
 - Lower barrier to adoption if the team is already using these platforms
 - Less transformative on their own than Cowork or the integrated suite agents — best framed as an incremental upgrade

Example of agentic coding

- Many possibilities on various levels.
 - Simple projects in single files can be done in the canvas of an AI chat.
- Interactive data manipulation example:
 - https://khliland.github.io/vaderoerna_agentic and https://github.com/khliland/vaderoerna_agentic
 - Tools: Visual Studio Code (VS Code) with GitHub Copilot (Claude Haiku 4.5) in «Plan» mode
 - Initial prompt: «I would like an interactive web app with two plotting areas. On the right, I want a score plot. On the left, I want raw data plotting. From experience, the combination of PyScript, JavaScript and Plotly has worked well for me. Do you have any first feedback on this?»
 - Copilot asked some questions about layout, interaction between the plots, and needed a couple of follow-up instructions to get the finished product.
 - I manually changed the amount of transparency of non-selected points.
